

ABSTRACT OF THE DISCLOSURE

Remote output environment remarkably improving convenience in remote output mode is provided so that print process according to original direction

5 information detected by transmitter image forming apparatus can be performed by receiver image forming apparatus. Therefor, image processing system including first device having input unit of inputting image data and communication unit of performing data

10 communication, and second device having communication unit of performing data communication and output unit of outputting image data sets the remote output mode for performing through the communication unit the data communication of the image data input by the

15 first device and causing the second device to output the communicated data, causes the first device to acquire the direction information input by the first device, and causes in this mode the second device to output the image data from the first device in output

20 manner based on the acquired information.
